Abstract (en)
[origin: EP2107188A2] The lock (1) has a locking housing (2), in which a closing mechanics is adjusted with a bolt element and a driver element (4) for reciprocal effect with a locking cylinder. The shifting of a selector element (5) is executed independently from the driver element, where releasing units are provided for reciprocal effect with the selector element, such that the releasing units are activated, before the adjustment of selector element between selector positions (A,B,C).
