Abstract (en)
[origin: EP2107190A2] The lock (1) has a releasable rotary unit acting together with a bolt element (3) for moving the bolt element between salient and retracted positions. A stop element (6) is transferred from an engagement position into a releasing position for opening of the rotary unit, without moving the bolt element, where the stop element is movable by a selector element (5). The stop element is transferred into a disengaging position by reciprocal action between the bolt element and the stop element, when the selector element is decoupled from the bolt element.
