Abstract (en)

[origin: EP2109192A1] The assembly has a circular electric wire guiding plate (12) arranged between a rear surface (3) of a connector (1) and a front surface of a connection. The connector has an electric contact whose barrel (8) receives a core of an electric wire traversing a retaining device (17). The barrel has a narrow zone (20) whose diameter is lower than the diameter of the core of the wire to assure an electrical continuity between the wire and the contact at the level of the narrow zone. An independent claim is also included for a method for cabling electric wires in a connecting assembly.
