Abstract (en)

[origin: WO2008074732A2] A printing press for printing printing-material webs is described, which printing press has at least two inking units (10, 20, 30) which in each case have a press nip (45, 46, 47), in which the printing image is transferred onto the printing material (1), and at least one web guiding section (41, 42) which comprises the web path between the at least two press nips (45, 46, 47), and at least one register regulator (50) which sets the maintenance of register of the print before and/or during printing operation. This is characterized by at least one controllable means (25, 35, 51, 52) for the targeted setting and maintaining of a web tension gradient (?F41) in a web guiding section (41,42) of the printing-material web (1), which controllable means (25,35,51,52) acts on the printing-material web (1) within the at least one web guiding section (41, 42), und by which controllable means (25,35,51,52) the relevant web guiding section (41,42) can be divided into web guiding part sections (41a,b;42a,b) with a different web tension (F41a,F41b), wherein the register regulator is set up in such a way that it actuates the at least one controllable means (25,35,51,52) for the targeted setting and maintaining of a web tension gradient (?F41).
