Abstract (en)
[origin: EP2110793A2] The device (1) has a switching unit i.e. changeover switch (5), connected with an auxiliary storage i.e. Universal Serial Bus (USB)-Stick (6) for intermediate storage of operational data. A data connection between a control unit (3) and the storage exists for the transmitting the data to a service unit (12) e.g. workstation, in a switching position of the switch, so that the data is transferred from the control unit to the storage. A data connection between the storage and a transmission unit (7) exists for transferring the data to the service unit in another switching position. An independent claim is also included for a method for transferring operational data from a self-service device i.e. information, vending or automated teller machine, to a service device.
