Abstract (en)

[origin: EP2112320A1] The method involves moving an end of a closing, blackout or solar protection screen between an open position corresponding to an open configuration of a screen and a closed position corresponding to a closed configuration of the screen. An actuator is controlled by a command transmitter i.e. blocked transmitter. A home automation system is switched over an operating mode, in which displacements of the moving end controlled from the blocked transmitter are prohibited when the moving end is in a security zone. An independent claim is also included for a home automation system comprising a closing, blackout or solar protection screen driven by an actuator and intended to block off an opening of a building.
