Abstract (en)  
[origin: EP2112564A1] The device (1) has a satellite carrier engaged with inner gear teeth (6a) of a clutch gear (4), and occupying engaged and disengaged positions in which a satellite (11) is in the positions, respectively. The gear teeth and the satellite are kinematically connected to a driving gear (2) and a driven gear (3) in the engaged position. The satellite does not cooperate with the driven gear in the disengaged position. An activating finger activates the carrier to pass from one of the positions to the other position, and a positioning jumper (22) positions the carrier in the positions. An independent claim is also included for a movement of a timepiece, comprising a driving gear.
