Abstract (en)

[origin: FR2911616A1] In a plant for producing a fiber- and/or filament-based sheet, comprising a first fluid-permeable moving element (1) displaced in one direction, a second moving element (2) and fluid jet projecting device (3), the first element moves (in the direction of the projected jets) between the jet projector and the second element at the point of projection of the jets onto the first element. Independent claims are included for: (1) a corresponding sheet production method, involving producing an assembly of fibers and/or filaments which can be defibrillated by a liquid jet on a fluid-permeable moving element, where the assembly is defibrillated by a fluid jet in such a way that fibers and/or filaments are projected onto a second moving element, on which they form a sheet; and (2) a non-woven having long fibers or filaments and short fibers (the length ratio of the long and short fibers being more than 10), where both the long and short fibers are present at all locations on the non-woven.
