Abstract (en)

[origin: WO2008101654A1] Disclosed is a dental laser treatment device (1) comprising a first light source for producing therapeutic radiation (40), a second light source for producing pilot radiation (41) in the visible range, transmission means (7, 8) for directing the therapeutic radiation (40) and the pilot radiation (41) to an area that is to be treated, and activation means (9) for selectively activating the transmission of the therapeutic radiation (40). According to the invention, when the therapeutic radiation (40) is emitted, the pilot radiation (41) is automatically switched off or suppressed.
