Abstract (en)

[origin: WO2008095717A1] A device (100,400, 500, 1400, 2100) for maintaining the fabric width of a fabric (200,3000) on a weaving machine according to the invention comprises a guide element (120, 520, 1420) for exerting a force on a fabric strip (225, 226, 3001, 3002, 3006) of the fabric in the weft direction towards the edge of said fabric strip. The device for maintaining the fabric width furthermore comprises a longitudinal profile (110, 510, 600, 700, 800, 901, 1410,) which produces a contact surface (251, 252, 1411) which is designed so that said force can be exerted by the guide element, and in which the longitudinal profile is intended to be woven into fabric strip.
