Abstract (en)

[origin: WO2008080868A1] Radiant module (10) and relative method of production, for a heating device for rooms, comprising two heat-conductor plates, respectively first (16) and second (14), associated with each other to define a central portion (18) inside which a heated heat-carrying fluid flows. The first heat-conductor plate (16) comprises lateral walls (20) which develop from the central portion (18) away from the second heat-conductor plate (14), to define a channel (28) inside the radiant module (10) which develops and narrows from the lower part of the radiant module (10) towards its upper part and through which a flow of heated air is accelerated and guided.
