Abstract (en)
[origin: WO2008092925A2] The electrode (10) in a lead acid battery is made up of at least one wire (12) containing lead or lead alloy and prefabricated by any mechanical, physical, chemical or electrochemical process, e.g. extrusion or cold-forming. The conductivity of the wire (12) can be varied by an inner core (26), made up of any conductive or non-conductive or semi-conductive material.
