Abstract (en)
[origin: DE102007004337A1] The method involves receiving data of a communication device (50) in a telecommunication terminal (20) e.g. mobile radio terminal. Transmission of the data via a security module (10) e.g. mobile telephone card, over a communication connection (80) is enabled or caused. A verification is made by the module to find whether an allocation certificate is present, where the certificate conforms to allocation of the connection for data transmission. A step of enabling or causing transmission of the data to a processing unit (60) e.g. internet server, is executed based on the verification. An independent claim is also included for a security module comprising a memory.
