Abstract (en)

[origin: EP2116312A1] The device has a roller (4) circulating around a longitudinal axis (3) of a milling product, where an axis (7) of the roller is inclined at the longitudinal axis. The roller stays in engagement with a sun gear (14) by a bevel gear (10) comprising external teeth (13), where the gear is connected with the roller in a torque-proof manner. The bevel gear is arranged, such that an axis of the bevel gear and the longitudinal axis lie in a common plane (Eo), where the bevel gear comprises internal teeth e.g. hollow wheel teeth, combing with a spur gear (17) comprising external teeth (18).
