Abstract (en)

[origin: EP2116502A1] The invention relates to the provision of lifting apparatus (2) for use in movement of goods between goods storage areas. The lifting apparatus includes at least a body module (6) including a frame (4) which supports scissor lift apparatus (18) and a platform (16) connected thereto. The module is formed under factory conditions and then transported to site which means that the conditions for forming the apparatus are improved in comparison to assembling the same on site and when the module are delivered to site the installation work is significantly reduced as the scissor lift is already installed with respect to the frame. The frame may also include a gangway (22) to allow access along and past the platform.
