Abstract (en)

[origin: WO2008098664A1] The invention relates to a dishwasher machine (1) comprising spray arms (9 to 11), a recirculation pump (5) which is driven by an electric motor (33), and a water point provided on the pump pressure side and used to produce a flow from an inlet (4) to at least one outlet (12 to 14) selected from several and associated with the spray arms (9 to 11). The water point comprises at least one blocking element (20) and a drive element for moving the at least one blocking element (20) which is driven together with the electric motor (33) of the recirculation pump (5). A simple water point drive is achieved in such a dishwasher (1) by mounting a transmission between the drive element and the blocking element (20), said transmission converting a continuous movement of the drive element into a discontinuous movement of the blocking element (20).
