Abstract (en)

[origin: FR2912660A1] The device (D1) has a tubular element (5) forming an internal main channel (7) and connected by its distal end to a respiratory tract of a person. A peripheral auxiliary channel (9) is emerged in the main channel and is continuously supplied by respiratory gas (J). A deflection unit (8) deflects respiratory gas jets that are continuously injected by the auxiliary channel inside the main channel. Controlling units (S1, S2) control an entry of exterior air in the tubular element at a beginning of each decompression imposed to a thoracic cage of the person.
