Abstract (en)

[origin: EP1970280A1] The method involves defining status information for components. A railroad network (N) is subdivided into sections (4, 6, 8). Separation information (4a, 4b, 6a, 6b, 8a, 8b) is added to each section. Current status information about the components is read after a request regarding the status of the sections. The components along with the status information are processed in a logically connected manner within the assigned separation information for a display (2). The processed information is displayed in a logically connected manner along with the respective status information.
