Abstract (en)

[origin: WO2008095483A2] The invention relates to a container (1) comprising a container wall (2), a container base (3) and a container opening (4), the container wall (2) extending in a substantially conically manner from the base to the opening and the inner face of the container wall (2) having spaced stacking ribs (5) running axially around the circumference. According to the invention, the container is developed in that the outer radial region of the exterior of the container base (3) is provided with at least one cavity (10), into which at least one stacking rib of a container (1) located below can engage when several containers (1) are stacked inside one another, thus fixing the containers (1) and preventing them from rotating in relation to one another. This improves the positional stability of the stacked containers.
