Abstract (en)
[origin: FR2912386A1] The installation has a closed cylindrical tank for receiving oil through a connecting conduit (421), which communicates with an electric pump (1) by a supply duct (41). The stored oil is evacuated from the tank by a connecting conduit (424). The tank is arranged in an underground housing volume formed by a wall made of steel. A heat insulation material (8) e.g. expanded polystyrene, is positioned around the tank, and a filling material (9) e.g. crushed hard rock, is positioned around the insulation unit. An underground passage (52) communicates with the tank for passage of the filling duct.
