Abstract (en)  
[origin: WO2008113714A1] The invention relates to a heat exchanger (1) for an air conditioning circuit, that comprises at least one tube (5) defining a path for the circulation of a first fluid and a second fluid, the tube being wound about an axis in order to define successive windings, said windings being tightly arranged against each other in order to define so-called sealed secondary channels (54) for the circulation of the second fluid, said secondary channels (54) being located between protruding areas of said tube (5), and said tube (5) including so-called main channels (52) at the protruding areas, in which the first fluid flows. The invention can particularly be used in air-conditioning for automotive vehicles.
