Abstract (en)

[origin: WO2008096295A2] Bus system (10) used in actuating systems for moving gates, roller shutters or the like, in which the transmission of signals between a control unit (C; 18) and peripheral components (17, 19, 20, 21, 22, 24; Q) is performed using a transmission protocol, characterized in that each peripheral component (Qn) is designed only to transmit its own signal to the control unit (Cn) solely within a time window (I1) situated in a predetermined position with respect to a period (T_B) for scanning the status of the peripheral components of the system (10).
