Abstract (en)

[origin: WO2008092513A1] A method is described for operating a wireless interconnected data network with a plurality of network nodes (MP1, MP2, MP 3, MP 4, MP S, MP D, NF MP) between which communications links (KV) exist, at least in part. At least some of the network nodes (MP1, MP2, MP 3, MP 4, MP S, MP D) forward received data packets to at least one of the network nodes (MP1, MP2, MP 3, MP 4, MP S, MP D, NF MP). At least one of the network nodes (NF MP) is designed as a prespecified network node. The prespecified network node (NF MP) suppresses the forwarding of data packets and the forwarding and/or the answering of data packets to the network nodes (MP1, MP2, MP 3, MP 4, MP S, MP D). Said data packets are transmitted in connection with the setting up of a data path in the data network and are not addressed to the prespecified network node (NF MP).
