Abstract (en)

[origin: FR2911789A1] The snow racket (1) has a shoe retaining unit permitting a shoe to rotate with respect to a deck (2) around transverse axes (X, X'). A climbing bar (9) limits rotation of a fixation type articulated plate (7) towards a base such that the plate is inclined towards the base and front, so that the shoe is in a horizontal position in case of rise. The bar includes a movable support piece (10) articulated on the shoe for attaining retractable inactive and active positions. A control unit (11) i.e. lever, allows a user to pass from the inactive position to the active position using the bar.
