Abstract (en)

[origin: FR2912438A1] The system has an edge rail or spear (10') made of a semi-flexible material. The spear has a degree of flexibility such that a wing (10'a) and a bead (10'b) are separated from one another at 45 degrees after the rail is inserted in a sill (3) in a manner that a portion of an inner side of the bead is in contact with a shoulder (8) to ensure maintenance of the spear in the sill by friction, where the inner side is a side opposite to the wing.
