Abstract (en)

[origin: FR2911595A1] The machine has displacement units that includes a vertical mounting/descending jack (81) connecting an attachment of a crown on a carriage (82), which is mounted on a guiding rail (83), where the crown is displaced around an axis of a reservoir using a rotational jack. The units displace a closing element from a retracted position to a service position by vertical translation towards bottom parallel to a longitudinal axis of a filling nozzle (32) along a horizontal displacement, perpendicular to the longitudinal axis so that the element is centered along the longitudinal axis.
