Abstract (en)

[origin: WO2008101624A1] The invention relates to a fastening device comprising a front power transmission element (1b) and a rear power transmission element (2b), wherein an armature (3) can be guided through the front power transmission element (1b) and the rear power transmission element (2b). In order to reduce the stress of the armature if the fastening device is not firmly clamped, the front power transmission element (1b) and the rear power transmission element (2b) are configured such that a shear force can be transmitted to the armature (3) exclusively by the rear power transmission element (2b).
