Abstract (en)

[origin: WO2008092793A1] The invention relates to an apparatus for determining and/or monitoring at least one process variable, having at least one first housing unit (1) which has at least one connecting section (3) for the mechanical connection of the first housing unit (1) to a connecting section (4) of a second housing unit (2). The invention comprises that the connecting section (3) of the first housing unit (1) is designed such that the connection of the first housing unit (1) to one of at least two second housing units (2) can be produced by way of the connecting section (3) of the first housing unit (1), wherein the at least two second housing units (2) differ from one another at least in the design of the connecting section (4).
