Abstract (en)

[origin: WO2008086903A1] The invention is a base (1) for antennas (A) comprising a support plate (2) that rests on a bearing surface (S) and a fixing device (3) suited to constrain the support plate (2) over a through opening (P). The fixing device (3) comprises: a sliding unit (5) associated with the support plate (2) and having a shaped 5 profile; a first shaped body (13) that can be inserted in the through opening (P), integral during rotation with the support plate (2) through the sliding unit (5) and mobile with respect to the support plate (2) along the longitudinal development axis (X) defined by the sliding unit (5); a second shaped body (10) interposed between the first shaped body (13) and the support plate (2), 10 wherein the shaped body (10) can be inserted in the through opening (P), is rotatably associated with the support plate (2) and has a profile that can be conjugated with the profiles of one section (7) of the sliding unit (5) and of the surface (6) of the support plate (2); elastic means (18) suited to force the first shaped body (13) against the bearing surface (S); means (16) for constraining 15 the shaped bodies (10, 13) to the support plate (2).
