Abstract (en)
[origin: EP2123404A1] The device (1) has an indicator for visually determining whether device parts e.g. clutch fork (3), have achieved an end press position. The indicator has a marking arranged on one of the device parts. The marking is partially covered by overlapping of the device parts in the end press position, so that the end press position is made visible. The marking is completely covered external to or in the overlapping of the device parts, after the device parts achieve the end press position. The device parts are moveable relative to each other between an initial position and the end press position.
