Abstract (en)

[origin: EP2123585A1] The method involves guiding a current material course (9) alternatively through one of two operating elongations (3,5), which are arranged at a distance from each other. An operating elongation is folded around a line parallel to a feed direction (D) and another operating elongation is disconnected by a longitudinal cutter (11) along a line parallel to the feed direction in two material course strands. An independent claim is included for a device for operating printed material course moved in a feed direction.
