Abstract (en)

[origin: EP2124209A1] The method involves exchanging data in the form of modulated signals in a high frequency range between a base station and a remote control. The signals are checked for validation (3) and are rejected if necessary. The rejected signals are buffered (4) and that a majority decision is carried out bit by bit with the subsequent validity checking for each odd number of the rejected signal, till a valid signal is generated or received.
