## Abstract (en)

[origin: WO2008121355A1] Botanically-sourced and botanically-derived emollient sanitation compositions for topical use are disclosed. Representative compositions generally aid reconstitution of the lipid profile of the stratum corneum (310) by providing botanical lipids and/or lipid-derivatives that resemble human sebum - these components being ordinarily diminished with the use of conventional hand sanitizer products. Disclosed features and specifications may be variously controlled, adapted or optionally modified to realize, for example, improved hand sanitizer formulations. Representative embodiments of the present invention generally provide anti-microbial compositions blended with botanically sourced lipids and/or lipid-derivatives to control or otherwise improve dermatitic symptoms (e.g., 320) associated with frequent use of conventional hand sanitizer products.
