Abstract (en)

[origin: DE102007014084B3] The method involves preparing a sheeting with layers, which correspond to the upper layers (24) of the seal disk (20). Continuous holes are pierced in the sheeting, where the holes are perforated at a distance that corresponds to the distance of seal disk, which is to be completely perforated. The seal disk comprises the complete area of a pull tab (30), which is responsible for the tightness of the seal disk in the opening (11) of the containers (10). The later sheeting is connected with the former sheeting after the punching process.
