Abstract (en)

[origin: WO2008089910A1] The invention relates to a valve device for a low-pressure supply system with a membrane unit (9) releasing a flow path in one direction only. The membrane unit comprises at least two membrane elements (9a, 9b), wherein at least one thereof deforms during operation of the low pressure supply-system so that the membrane elements come in contact with each other and the oscillations of the membrane unit are damped.
