Abstract (en)

[origin: FR2913280A1] The device has a magnetic field generator (30) placed outside a non-magnetic cylindrical duct (20). A permanent magnetic field generator (23) is placed inside the duct and separated from the external generator by a non-magnetic separator wall. The generator (23) is connected to a valve (21) and includes an internal face (31) that is spaced apart from the wall. The generator (23) is carried by a non-magnetic guide part. The part has guide washers (25, 26) located adjacent to the wall beyond ends of the permanent generator with respect to a direction of a generated magnetic field.
