Abstract (en)

[origin: WO2008092501A1] The invention relates to an electronic operating device for the incremental dimming of one or more lighting devices, wherein the operating device has two or more gate inputs, which may be conducting or non-conducting, and wherein it dims the lighting device or devices to various lighting levels based on the circuit combination of the gate inputs. The lighting values corresponding to the dimming levels can be firmly programmed, or can be freely programmed by means of different methods.
