Abstract (en)  
The present invention relates to a suction head for vacuum cleaner, comprising: a tube section (11); a first joint section (12) for connecting with a first connecting tube, which is disposed at the front end portion of the tube section (11); a second joint section (13) for connecting with a second connecting tube, which is disposed at the rear end portion of the tube section (11); a suction section (14) which extends from the exterior wall of the tube section (11) toward the front end of the tube section (11) so as to cover the first joint section (12); a suction inlet (15) disposed at the front end of the suction section (14); and a hairbrush (16) formed by hair-planting at the edge of the suction inlet (15). The present suction head for vacuum cleaner may be used to clean the corners of a room in the same way as a conventional small suction head, and the suction head for vacuum cleaner may be connected with a floor suction head at its front end without removing the suction head for vacuum cleaner. The convenience of replacing suction head frequently may be avoided, and thus both the convenience in use and cleaning efficiency are improved considerably.
