Abstract (en)

[origin: EP2127763A1] To handle an object (8) in a processing system (1) having at least one output arranged in at least one column, wherein the object (8) is provided with a first electronic identification (ID) device (12), and wherein a second electronic ID device (2) is assigned to a column, a first signal indicates a need for a transfer of the object (8) by an operator (10) at a predetermined output, and a second signal indicates that the operator (10) grasps the object (8) at the predetermined output. At least one of the second ID devices (2) is energized to emit a device identification. The device identification and an ID signal identifying the operator (10) grasping the object (8) at the predetermined output are detected. In response to the first and second signals, data from a control system (14) is transmitted via the identified operator (10) to the first ID device (12) of the object (8) to store the data on the first ID device (12).
