Abstract (en)

[origin: EP2127828A1] The device has a receiving device (34) that is arranged downstream of a cutting device (20). The receiving device has a receiving unit (38) at which an output pile (18) with a side surface is connected. The receiving unit pivots from an output position to a tilting position during separation of use pile (32). The receiving unit has a holding handle (64) that projects downwardly opposite to a contact surface (36) of the receiving unit. The holding handle is raisable by a lug drive unit relatively to a supporting surface (10) and is lowerable on the output pile.
