Abstract (en)

[origin: EP2128055A2] The device has a stacking space (1) with a supporting arrangement for supporting a stack of objects (2), and a suction device (4) and a gripper (5) for separation of the objects from the stack. An onward transportation unit (6) e.g. conveying belt, is provided transports the separated objects, where the arrangement is a roll bed conveyor with circulating rollers (9) moved along an orbit (11). The rollers are coupled to a roller wheel (7) by a coupling (8) and pivoted by a control runner (15) in a release region (13) of an orbit for creating an opening through which the unit (6) is routed.
