Abstract (en)
A scaffold element (1) for placing between a set of scaffold parts, intended and adapted to receive a further scaffold part (15) thereon, comprises an intermediate bar (3) with a support member (5) on opposite outer ends for supporting therewith on either side on the set of scaffold parts (17). On the opposite outer ends of the intermediate bar locking members (9,11) which are movably connected thereto are provided for co-action with the set of scaffold parts (17). The locking members each comprise a locking part (11) for locking to the scaffold part (17) and an operating part (9) for actuating the locking part (11). In the unlocked situation the operating part (9) protrudes outside the intermediate bar in order to receive the further scaffold part thereon. Under the load of the further scaffold part (15) the operating part carries the locking part to a locking situation in which the intermediate bar is not connected in freely releasably manner to the set of scaffold parts.
