Abstract (en)  
A lighting apparatus (100) is proposed. The lighting apparatus includes at least one lighting body (105, 110). Each lighting body includes socket means (125) for mounting a lighting source (130), and a covering structure (135, 140, 145) for enclosing the lighting source when mounted in the socket means. The covering structure includes a first and a second base elements (140, 145) arranged at opposite positions with respect to the lighting source when mounted. The covering structure further includes a lateral element (135) adapted to slide around the first and the second base element, and constraining means (120, 150, 230) for constraining the lateral element with respect to the first and second base element when positioned between the first and the second base element.
