Abstract (en)

[origin: WO2008106939A1] The invention relates to a turnstile system comprising a locking unit (1) which is associated with the turnstile system in a rotationally fixed manner and allows the turnstile system to be incrementally moved with the help of corresponding locking members and thus access to be controlled to an area that is secured by means of the turnstile system. According to the invention, such a locking unit (1) is advantageously produced as a sandwich structure by screwing together several plates (2, 4, 6) and placing spacers (5) therebetween rather than using a massive base plate. In an advantageous embodiment, the pawls (13, 13') that cooperate with a switching disk (3) can be differently hinged to obtain different functionalities and a different currentless behavior in accordance with the application. The invention is used in access control devices.
