Abstract (en)

[origin: FR2914402A1] The device has an O-ring (24) arranged between a cylindrical unit (30) of a profiled body (12) and a cylindrical housing of a support (10). The ring is maintained on one of components chosen from the profiled body and the support so as to permit relative movement of the profiled body and the support by sliding the ring on other components selected from the profiled body and the support, where the device is made up of a plastic injection material. An independent claim is also included for an aerator comprising a passage for air flow.
