Abstract (en)

[origin: EP2130741A2] The method involves locating a part of the mobile telephones in a train (Z). A railway system lies in a service area of a cellular mobile radio system. The trains move along a railroad (W) through the spatial areas (LA1,LA2) of the mobile radio system. A collective data is detected for the spatial areas, where the data indicates the changing points of time that are determined by evaluating the collective data. Independent claims are included for the following: (1) a system for localizing trains in a railway system; and (2) a control center for a system for localizing trains in a railway system.
