Abstract (en)

[origin: EP2130772A1] The method involves obtaining blanks (10) by separation of a continuous material web (11), and attaching a press cut in form of recess and/or a punch hole on the blanks. The blanks are separated from the material web, and the press cut is attached in an area of a cutting device (19). The material web is conveyed to the area of the cutting device in a synchronized manner. Separation of the blanks and attachment of the press cut are carried out during short-time idleness of the material web such that the material web is transported along a conveying plane in the area of the cutting device. The flat springs are made of glass fiber composite material. An independent claim is also included for a device for manufacturing blanks for cigarette packages.
