Abstract (en)

[origin: EP2130775A1] The foil is attached between an upper layer and a lower layer (2) and exhibits anti-slide characteristics, where the foil is assembled in foil strips (1). The length of the foil strip is greater than the width of the foil strip. The foil strips are arranged between the lower layer and the upper layer in such a manner that the strips cover maximally 60 percentage of a contact area of the lower layer using the upper layer. The width of the foil strips is about 150 millimeter. The foil is rolled-up on a rolling device whose roller width corresponds to the width of the strips.
