Abstract (en)  
[origin: WO2008092600A1] A transverse conveyor for logs (60) comprises conveyor sections following one after another in the direction of conveyance (31): a first conveyor section (32) running with a first speed ( $v_{<SUB>1</SUB>}$ ), a second conveyor section (34) running with a second speed ( $v_{<SUB>2</SUB>}$ ), and a third conveyor section (36) running with a third speed ( $v_{<SUB>3</SUB>}$ ). The second conveyor section (34) comprises a conveyor plane (46) above a conveyor plane (48) of the third conveyor section (36). Equalizing rollers (50) are arranged transversally to the direction of conveyance (31) at the transfer from the second conveyor section (34) to the third conveyor section (36), said equalizing rollers being raised above the conveyor plane (46) of the second conveyor section (34). The first speed ( $v_{<SUB>1</SUB>}$ ) can be set differently for the purpose of separating the logs (60). The second speed ( $v_{<SUB>2</SUB>}$ ) and the third speed ( $v_{<SUB>3</SUB>}$ ) are constant. The third speed ( $v_{<SUB>3</SUB>}$ ) is greater than the second speed ( $v_{<SUB>2</SUB>}$ ), and the second speed ( $v_{<SUB>2</SUB>}$ ) can always be set to be greater than the first speed ( $v_{<SUB>1</SUB>}$ ) (figure 3).
