Abstract (en)

[origin: WO2008119460A1] The invention relates to a drive rod arrangement for a window, door or similar, comprising at least one drive rod and at least one drive rod guiding element for maintaining the drive rod within a displacement area of the drive rod. The drive rod guiding element comprises a fastening element that reaches through a guiding slit of the driving rod and a maintaining element overlays the top side of the drive rod. According to the invention, the cross-section of the drive rod (2) is profiled, at least in the displacement area (10), in such a manner that when the maintaining element (7) and driving rod are touched, only one line contact is established or several line contacts are established.
